

Take-Home Task

Manager, Workforce Management | Care Experience & Strategy

We enjoyed our initial conversations and getting to know more about your motivation and expertise. We'd like to invite you to the next step of the process to prepare a short take-home task. We will review your submission, and if you are successful, you will be invited to a face-to-face interview where we ask you to present your work and we will engage in a Q&A. We are looking forward to receiving your work.

Objective

At GetYourGuide, the Care Department plays a critical role in ensuring customers, suppliers, and partners receive exceptional support. The Workforce Management team is in the middle of a fundamental transformation — moving from manual, Google Sheets-based forecasting to an AI-driven model that is faster, more accurate, and built to scale.

As Manager of Workforce Management, your role will involve owning the forecasting and planning capability that this transformation depends on. This exercise will assess your ability to:

- Diagnose the limitations of a manual forecasting approach at scale
- Build and interpret a workforce management forecast using real operational data
- Think strategically about how to lead a team through a complex technical transformation
- Apply AI tools practically in your work — and reflect critically on how you used them

What We're Looking For

Forecasting rigour	A credible capacity model built from real data, with clear assumptions and methodology
Analytical thinking	Identification of data quality issues, reasoned assumptions, and outputs translated into operational recommendations
AI fluency	Practical, documented use of AI tools — with honest reflection on what worked and what didn't
Strategic clarity	A realistic, prioritised plan for leading the forecasting transformation
Communication	Clear, concise outputs that a senior operational audience can act on

Submission Guidelines

Format	Submit as: (1) a PDF or slide deck (max 5 slides / 3 pages) and (2) the provided dataset with your working shown
---------------	--

Time limit	Spend no more than 3-4 hours preparing your response. We are looking for your approach, not perfection.
Deadline	Submit your completed task within 5 business days
AI usage	You are welcome to use any AI or data analysis tools. We ask you to cite your usage and document how you used AI.

Section 1: Workforce Management Forecasting

The Care Department is planning for the next quarter. You have been provided with historical data on contact volumes, AHT, and shrinkage rates (January – June). This is a generic fictional Care dataset, which also contains data anomalies etc. Clean the data and use the datapoints you need for the following tasks.

Task 1a — Capacity Forecast

Develop a forecast for the required capacity (FTE and productive hours) to support contact centre operations for the next three months.

- Assume a 10% increase in customer contacts due to seasonal demand
- Account for shrinkage rates and ensure service level targets are met
- Show your methodology clearly — we want to understand your approach, not just the output

Deliverable: Summarise your forecast in a format suitable for operational teams (e.g. a table, chart, or spreadsheet with accompanying explanations). Include any underlying assumptions or additional data you would like to consider, and a plan for how you would leverage your team to execute against this forecast.

Task 1b — Optimisation Strategies

Propose 2 actionable strategies to optimise workforce scheduling and improve efficiency.

These should be grounded in the data you have analysed — not generic WFM best practices. Consider: channel mix, language routing, shrinkage reduction, or scheduling pattern changes.

Task 1c — AI Usage (Required)

Document how you used AI in completing this section.

- Where did you use AI? (e.g. data cleaning, formula building, structuring your model, drafting outputs)
- Which tools did you use, and how?
- What was the quality of the AI output — what did you accept, what did you change, and why?
- If you were to do this again, what would you do differently with AI?

We are not looking for maximum AI usage — we are looking for good judgement about when and how to apply it. Honest reflection on what worked and what didn't is more valuable than a polished narrative.

Section 2: Transformation Roadmap — How Would You Lead the Change?

This is a build role, not a maintain role. You will be leading a team of three WFM specialists through a significant technical and cultural transformation — replacing a manual forecasting model with an AI-driven approach.

Question 2a — 30/60/90 Day Plan

Outline a high-level first 30/60/90 day plan for how you would approach the transition from manual to AI-assisted forecasting.

We are not looking for a generic onboarding plan. We want to understand how you would sequence the work:

- What would you do first, and why?
- What decisions would you need to make in the first 30 days before you can move forward?
- What would 'done' look like at 90 days?

Question 2b — Bringing the Team Along

How would you bring your team of three WFM specialists along — including developing their AI capabilities?

Consider: how you would assess where each person is starting from, how you would set expectations, and how you would build AI capability without disrupting day-to-day operations.

Question 2c — Measuring Progress

What would you measure to know the transformation is on track?

Be specific. We are looking for metrics that are meaningful for this transformation — not a generic KPI list. Consider both leading indicators (are we building the right things?) and lagging indicators (is forecast accuracy improving?).

Good luck — we look forward to reviewing your submission.
